

# Harriet Tubman Middle School Air Quality Monitoring Phase II

Phase II, Presentation to ETAC  
10/29/2018

## Harriet Tubman Middle School:

- Located 60-350 feet (20 – 125 m) from I-5
- 7 lane highway
- >120,000 vehicles/day

In January 2018, PPS selected PSU to lead an evaluation of air quality issue at site

- Phase I: Outdoor air quality monitoring (March – April 2018)
- Phase II: Indoor/outdoor air quality monitoring, wind tunnel (Aug – Oct 2018)
- Phase III (planned): IAQ/OAQ monitoring after 1 school year (April 2019)

# Phase I outcomes: Air quality

---

**Finding #1:** There is a gradient of traffic related pollutants....reaching background levels about 200-300 feet from the freeway.

**Finding #2:** Air sampled on the SW side (freeway side) of Tubman Middle School is heavily impacted by freeway emissions.

**Finding #3:** Many air pollutants measured at Tubman are elevated compared to Portland urban background site (DEQ SE Lafayette).

**Finding #4:** Air pollutants of concern in HVAC outdoor ventilation air can be reduced ... below urban background and levels of health concern.

Paraphrased from Phase I report

# Renovation post phase I

## Major renovation of school included:

- HVAC system with MERV16 particle filtration
- Gas-phase air cleaning w/ broad spectrum activated carbon filtration
- Improvements to building shell

# Goals of Phase II air quality campaign

---

## Goals of HTMS Phase II:

1. Characterize indoor and air quality at HTMS following renovation
  - a. Outdoor air pollution levels in Fall season
  - b. Exposure levels to air pollution inside school
2. Is the HVAC air cleaning system performing as designed?
  - a. Particle-phase air pollutants (MERV 8 + MERV 16 filter)
  - b. Gas-phase air pollutants (Carbon filtration)
3. To what extent is there infiltration of outdoor pollutants through the building envelope?
4. How do air pollution levels vary spatially near vicinity of HTMS?

# Timeline of events

1. Co-location of two sets of instruments in the same room (221)  
→ from the 08/20 to 08/22
2. Indoor and AHU sampling with presence of confounders  
→ from 08/22 to 10/04
3. Indoor and AHU sampling post-confounders  
→ from 10/05 to 10/19
4. Outdoor air gradient sampling  
→ 08/24, 08/25, 08/30, 09/07, 09/10, 10/10 and 10/15
5. PurpleAir Sensor Network  
→ in classroom : from 08/24 to present  
→ outdoor : from 09/10 to present

# Goals of Phase II air quality campaign

---

Aug 20<sup>th</sup>, 2018

Aug 20<sup>th</sup>, 2018

Oct 1st, 2018

## Issues resulted in delay of ETAC (currently scheduled for Oct 29):

- Wildfire smoke events - **abated mid Sept**
- Ongoing presence and usage of diesel construction equipment - **fully abated as of Oct 3**
- Construction/renovation/cleanup inside and outside of building – **fully abated as of Oct 6**
- HVAC system not fully operational – **tuning/balancing completed mid to late Sept**

## **Sampling completed in AHU (RA, OA, SA):**

### *Particle-phase compounds:*

- Black Carbon (BC)
- Size resolved particles (PM<sub>2.5</sub>, PM<sub>10</sub>)
- Ultrafine particles\* (UFP)

### *Gas-phase compounds:*

- Nitric oxide (NO)
- Nitrogen dioxide (NO<sub>2</sub>)
- Volatile organic compounds via GC-MS
- Carbon monoxide
- Carbon dioxide (proxy for occupancy)

## **Indoor/outdoor sampling:**

- Network of purple air sensors
- Walking transects for UFP
- Passive NO<sub>2</sub> sensors

## **Site meteorology**

- Weather station
  - Wind direction
  - Wind speed
  - Temperature
  - Humidity

\*damage to monitor from high RH in AHU prevented long-term monitoring

---

# Goal 1: Indoor and outdoor air pollution

---

1. Characterize indoor and outdoor air quality at HTMS following renovation
  - a. Outdoor air pollution levels in Fall season
  - b. Exposure levels to air pollution inside school

# Overview of sampling

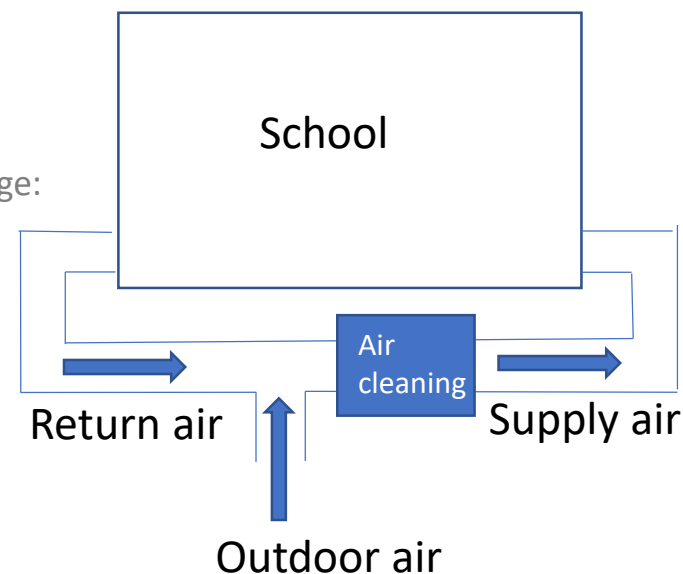

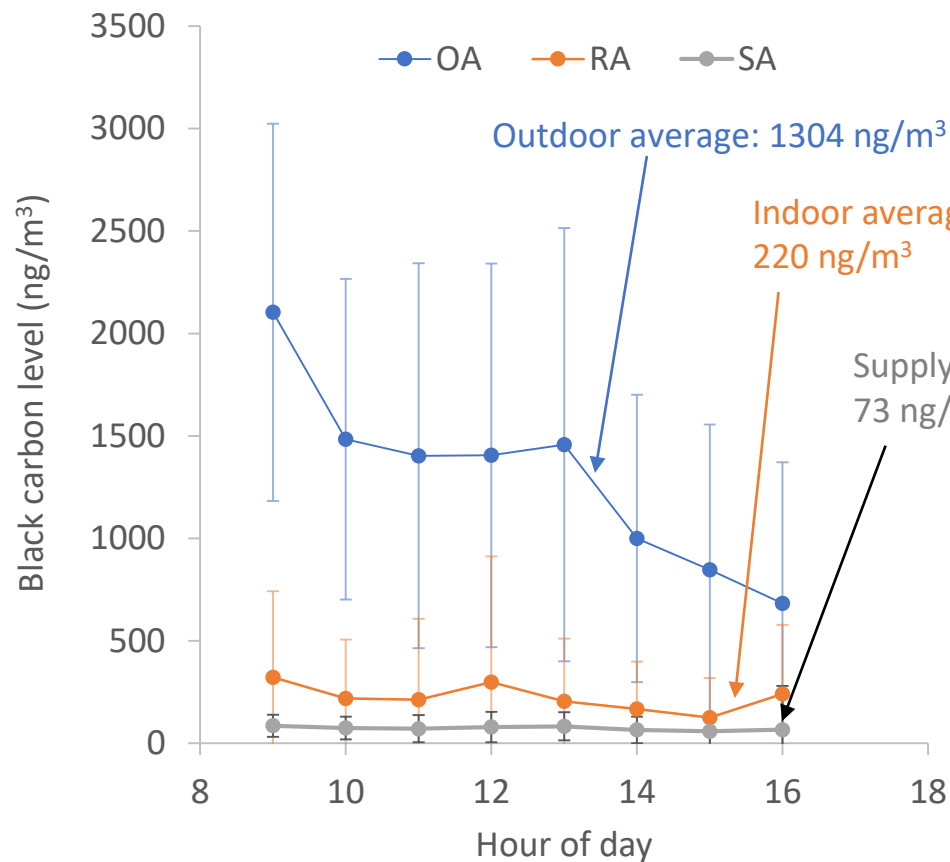

A = set 1 (blue cart)  
 B = set 2 (red cart)

# Weather Station

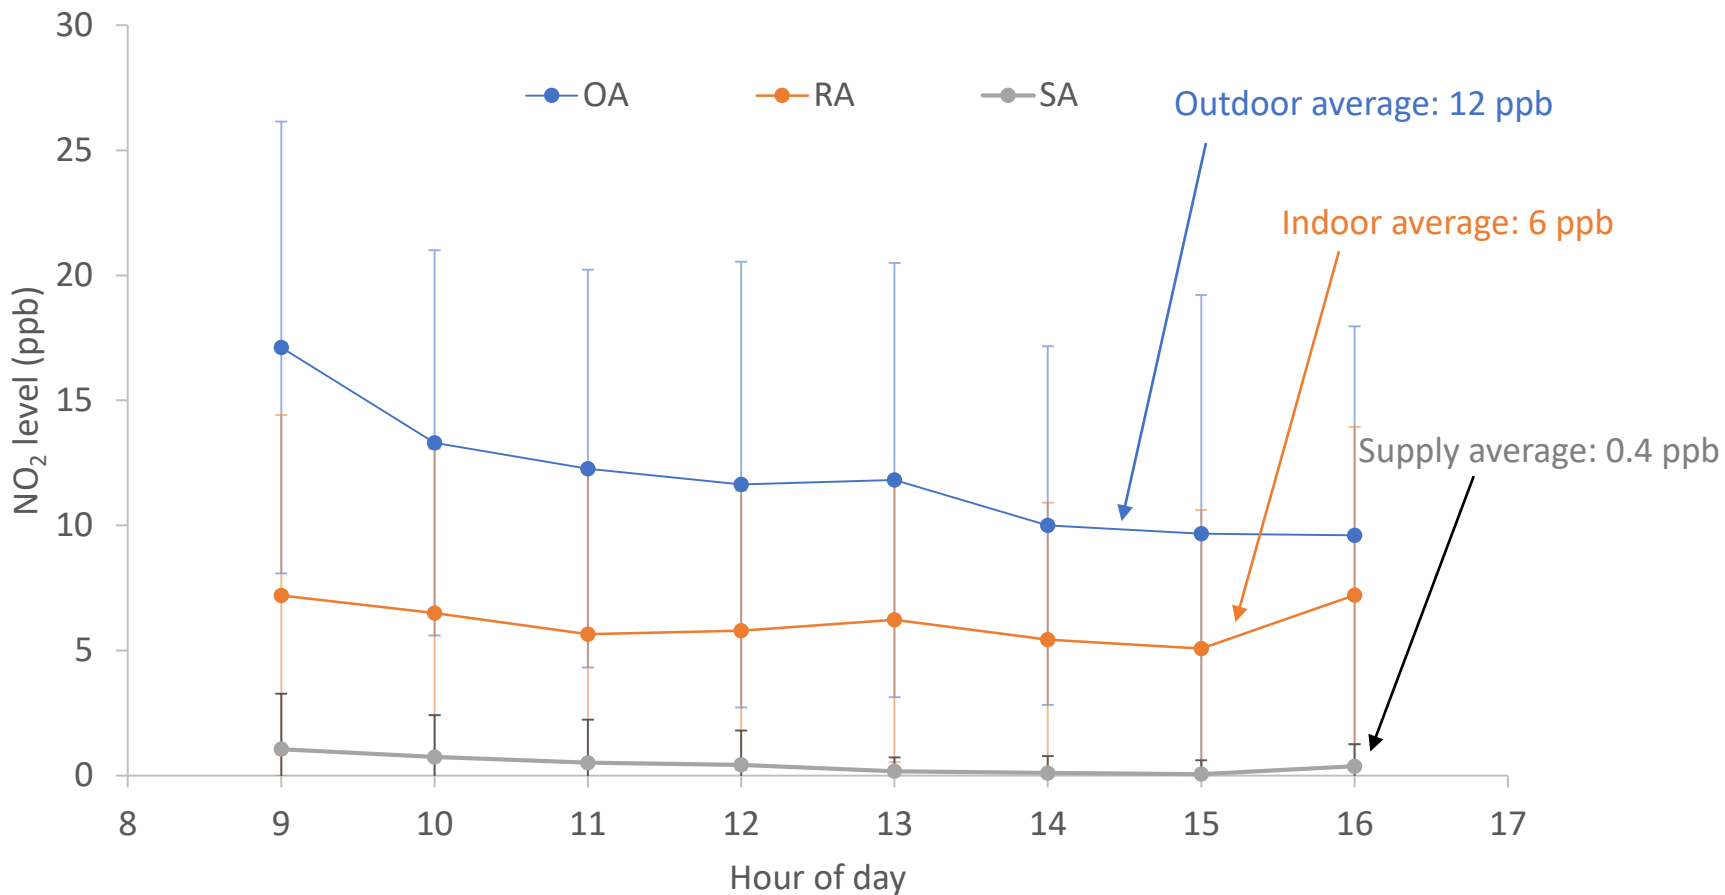

# Air pollutant trend example: BC

Hourly averages from 10/6 – 10/19, 9 AM – 4 PM only

# Air pollutant trend example: NO<sub>2</sub>

Hourly averages from 10/6 – 10/19, 9 AM – 4 PM only

# Indoor/outdoor levels: particles

Averages from 10/6 – 10/19, 9 AM – 4 PM only\*

- HVAC system addresses all particle-phase constituents
  - However, indoor activities are strong sources of PM<sub>10</sub>, PM<sub>2.5</sub>
- Low indoor/outdoor ratio of BC and UFP, implies HVAC and building protective
  - UFP is based on two days of monitoring only

# Indoor/outdoor levels: non-VOC gases

Averages from 10/6 – 10/19, 9 AM – 4 PM only

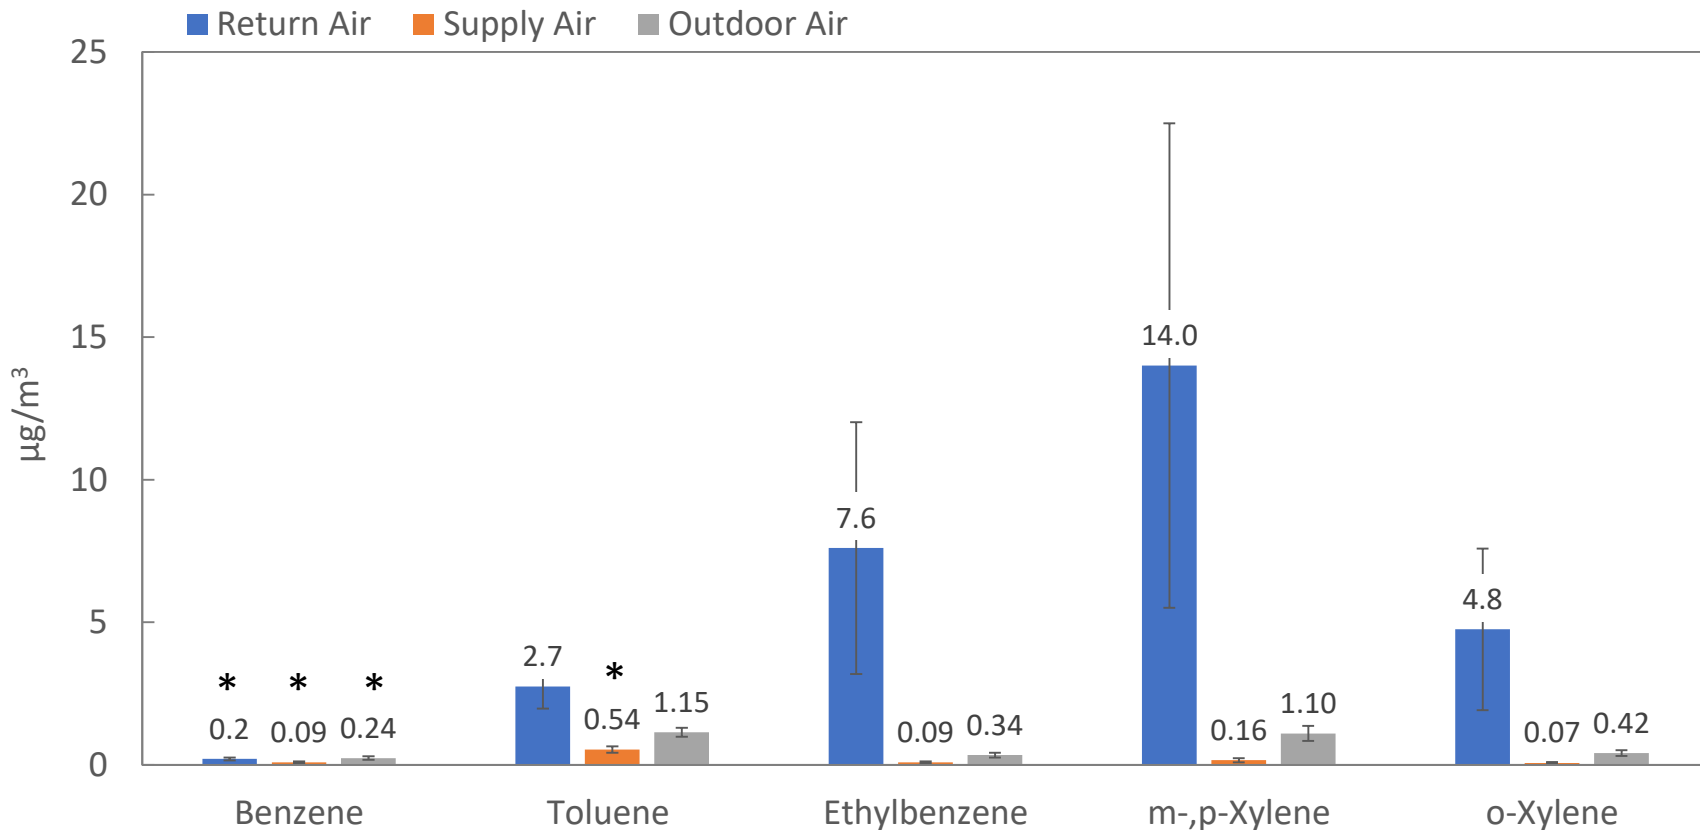

- HVAC system removes NO<sub>2</sub>, not NO and CO, results are as expected for NO, CO
- I/O ratio for NO<sub>2</sub> of ~0.5, implies some infiltration along small cracks + gaps

# BTEX: VOCs indoors, outdoors, supply air

Averages are shown over three points in time

Values for TEX decrease with time e.g., ethylbenzene 23 → 2.8 → 0.3  $\mu\text{g}/\text{m}^3$  across 3 weeks

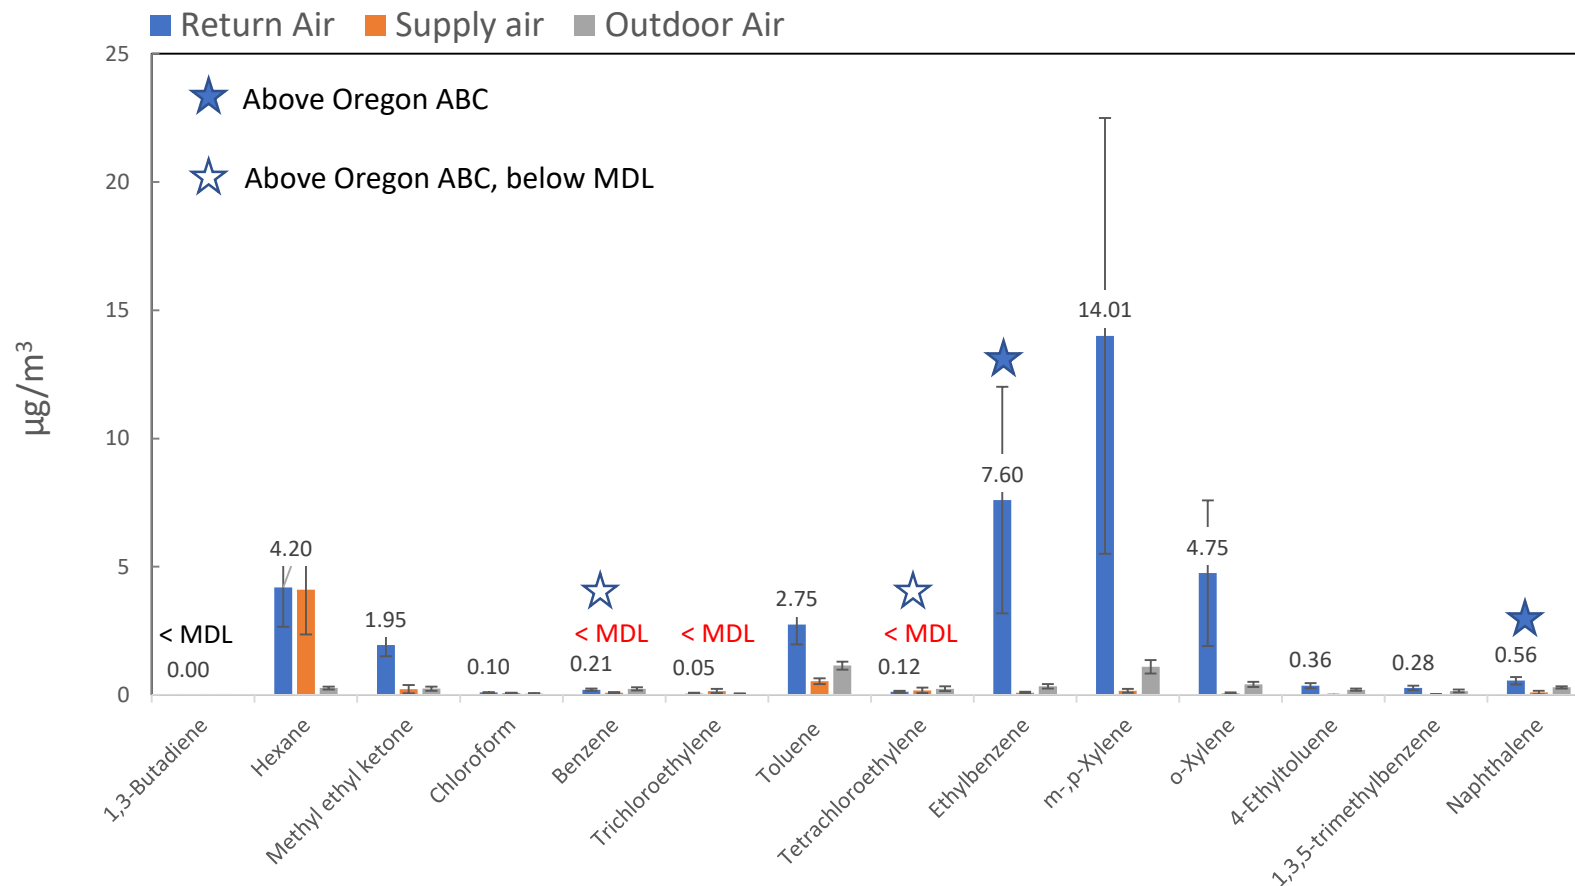

**Average 7 replicates taken on weekdays in the timeframe of 9 AM – 4 PM between 18 Sept. to 10 Oct.**

\* < MDL

# VOCs indoors, outdoors, supply air

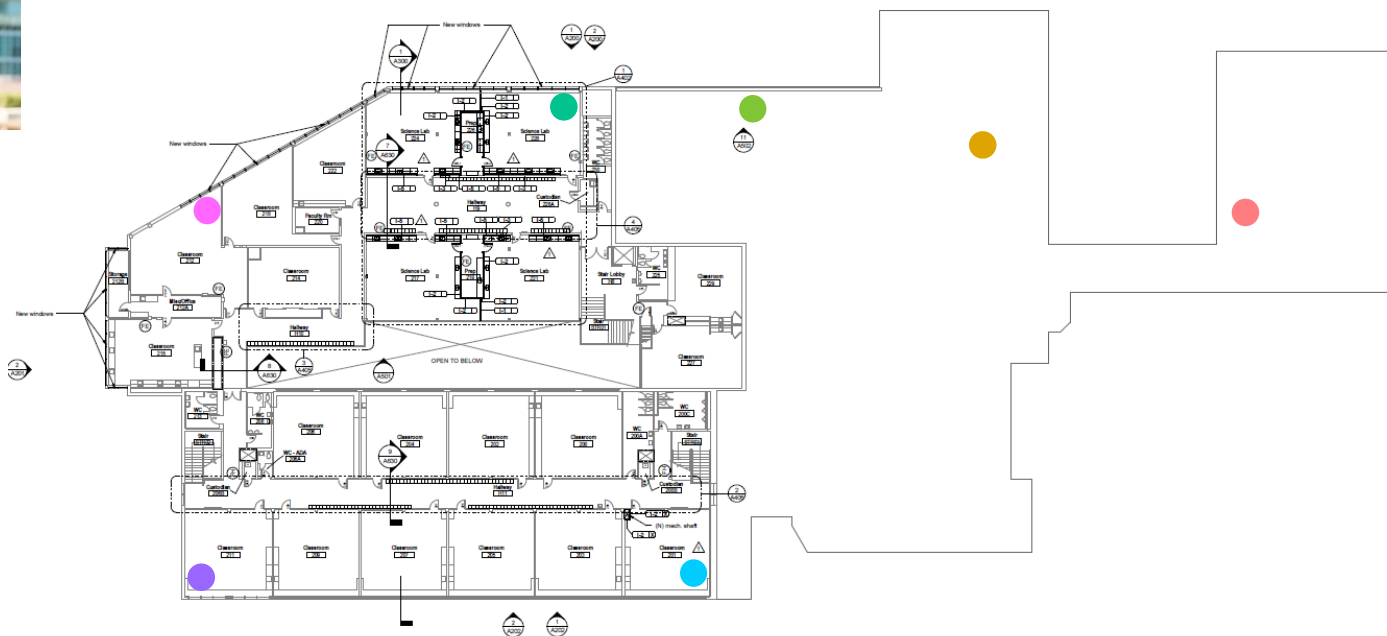

**Average 7 replicates taken on weekdays in the timeframe of 9 AM – 4 PM between 18 Sept. to 10 Oct.**

# Deployment of Purple Air sensors

PurpleAir sensors:

- Room 215
- Room 221
- Room 211
- Room 201
- Gymnasium
- Penthouse
- Basketball field

PM1.0 in  $\mu\text{g}/\text{m}^3$

- Room 215
- Room 221
- Room 211
- Room 201
- Gymnasium
- Penthouse
- Basketball field

Mean and 95% confidence interval in mean

## Summary of Goal 1 objectives

### Indoor levels of TRAP indicators are substantially below outdoor levels:

- Black carbon averaged 220 ng/m<sup>3</sup> indoors vs. 1300 ng/m<sup>3</sup> outdoors
  - Oregon ABC is 100 ng/m<sup>3</sup>, typical PDX BG: ~1000 ng/m<sup>3</sup>
- UFP levels: 1500 #/cm<sup>3</sup> vs. 33,000 #/cm<sup>3</sup> outdoors
  - Typical urban PDX UFP: ~5000-7000 #/cm<sup>3</sup>
- NO<sub>2</sub> levels: 6.1 ppb vs. 12 ppb outdoors
  - Indoors is below 2016 PDX annual average of 9 ppb

### Volatile organic compounds (BTEX)

- Benzene: 0.2 µg/m<sup>3</sup> indoors vs. 0.24 µg/m<sup>3</sup> outdoors
  - Portland background ~0.6 µg/m<sup>3</sup>, ABC of 0.13 µg/m<sup>3</sup>
- Toluene, xylenes below ABC, but elevated

TEX levels appear to be diminishing with time, likely result from renovation

# Goal 2. HVAC + air cleaning effectiveness

---

Goal 2. Is the HVAC and air cleaning system performing as designed?

- a. Particle-phase air pollutants (MERV 8 + MERV 16 filter)
- b. Gas-phase air pollutants (Carbon filtration)

AHU air cleaning

Outdoor air penthouse

# Effectiveness of air cleaning

Removal: mixed air (calculated) to supply air

Compound	Observed removal eff
<i>Gas-phase compounds</i>	
Carbon monoxide	37% removal
Nitric oxide	15% addition
<b>Nitrogen dioxide</b>	96% removal
<i>Particle-phase compounds</i>	
<b>Black carbon</b>	93% removal
<b>PM<sub>2.5</sub></b>	90% removal
<b>PM<sub>10</sub></b>	80% removal
<b>UFP</b>	98% removal

- Removal of measured compounds generally in-line with expectations
- Bold compounds are those w/ expected removal due to filtration/carbon

# Effectiveness of air cleaning

Removal: mixed air (calculated) to supply air

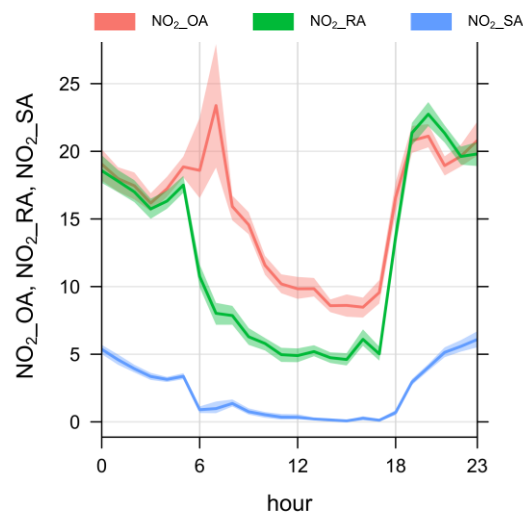

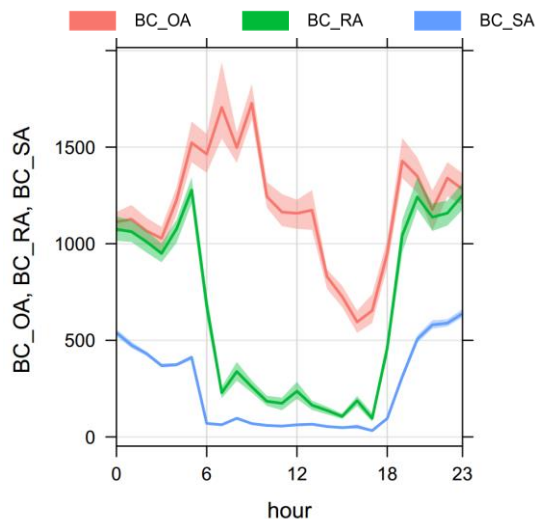

VOC	Observed removal eff	
	Sampling 1 (3 reps)	Sampling 2 (7 reps)
<b>Benzene</b>	66% removal	61% removal
<b>Toluene</b>	52% removal	65% removal
<b>Ethylbenzene</b>	94% removal	96% removal
<b>m, p- xylene</b>	94% removal	96% removal
<b>o-xylene</b>	95% removal	95% removal

- Removal of measured compounds generally in-line with expectations  
 >90% removal for ethylbenzene and xylenes
- Benzene and toluene substantially lower  
 Confirm residence time through activated carbon filter is > 0.1 s

Outdoor air appears to be introduced between 5 – 6 AM, elevated until ~ 6 PM.

Coincides with presence of morning rush hour: may save energy, extend filter/carbon life if delayed

# Goal 2. HVAC + Air cleaning effectiveness

---

## Summary of Goal 2 objectives

Air cleaning systems are operating mostly in line with expectations

- Particle removal generally effective
- Lower PM<sub>10</sub> removal than expected possibly due to resuspension in newly built AHU
  - Expect this to improve in time
- Gas-phase removal for BTEX
  - Ethylbenzene and xylenes in-line with manufacturer statement
  - **Benzene, toluene lower removal than anticipated**
  - **Confirm flowrates from AHU**
- Timing of outdoor air supply – explore delaying start of outdoor air supply

# Goal 3. Assess potential for infiltration

Goal 3. To what extent is there infiltration of outdoor pollutants through the building envelope?

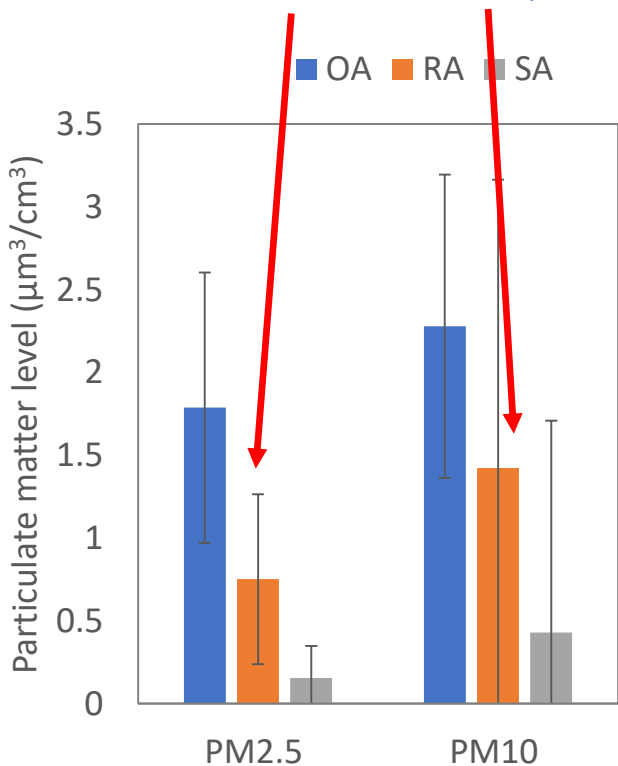

Indoor exposure levels DO NOT equal supply air levels  
leaving air handling system

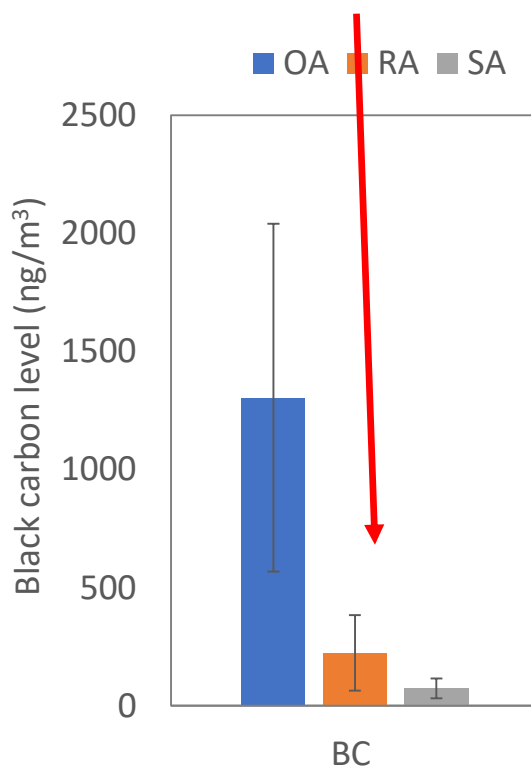

# Comparison of supply and return

Infiltration and other indoor sources create differences in supply and return air

Relatively strong indoor sources of PM<sub>2.5</sub>, PM<sub>10</sub>

Few indoor sources of BC, likely infiltration indicator

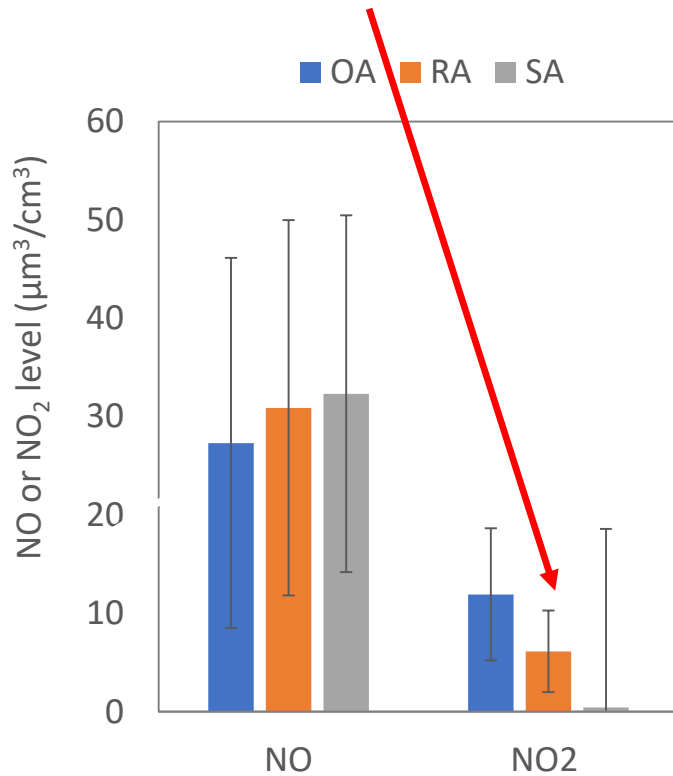

Few indoor sources of UFP

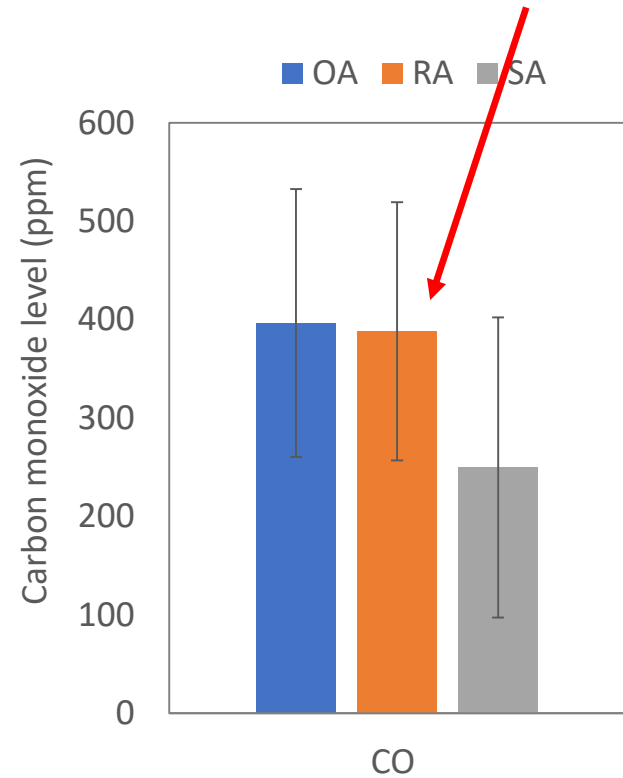

# Comparison of supply and return

Infiltration and other indoor sources create differences in supply and return air

Few indoor sources of NO<sub>2</sub>, likely infiltration indicator

Few sources of CO

# Pollutant polar plots as assessment tool

BC levels in  $\text{ng}/\text{m}^3$

Polar plot for BC in outdoor air

Polar plot for BC in return (indoor) air

## Summary of Goal 2 objectives

Building shell appears protective

- I/O ratio (indoors/outdoors) – in this case, return/outdoor
- **Generally a relative indicator** of indoor vs. outdoor origin (Chen et al. 2011)

Compound	Indoor/outdoor ratio
Black carbon	0.17
Ultrafine particles	0.044
PM <sub>2.5</sub>	0.42
PM <sub>10</sub>	0.62
NO <sub>2</sub>	0.51

- Higher PM<sub>2.5</sub>, PM<sub>10</sub> I/O ratios generally assumed to indicate indoor sources
- The lower BC, UFP I/O ratios imply building is protective (less so for BC)
- High NO<sub>2</sub> I/O ratio, given no indoor sources, implies infiltration for gases and certain particles

# Goal 4. Spatial variation of air pollution

---

## Goals of HTMS Phase II:

4. How do air pollution levels vary spatially in the near vicinity of HTMS?

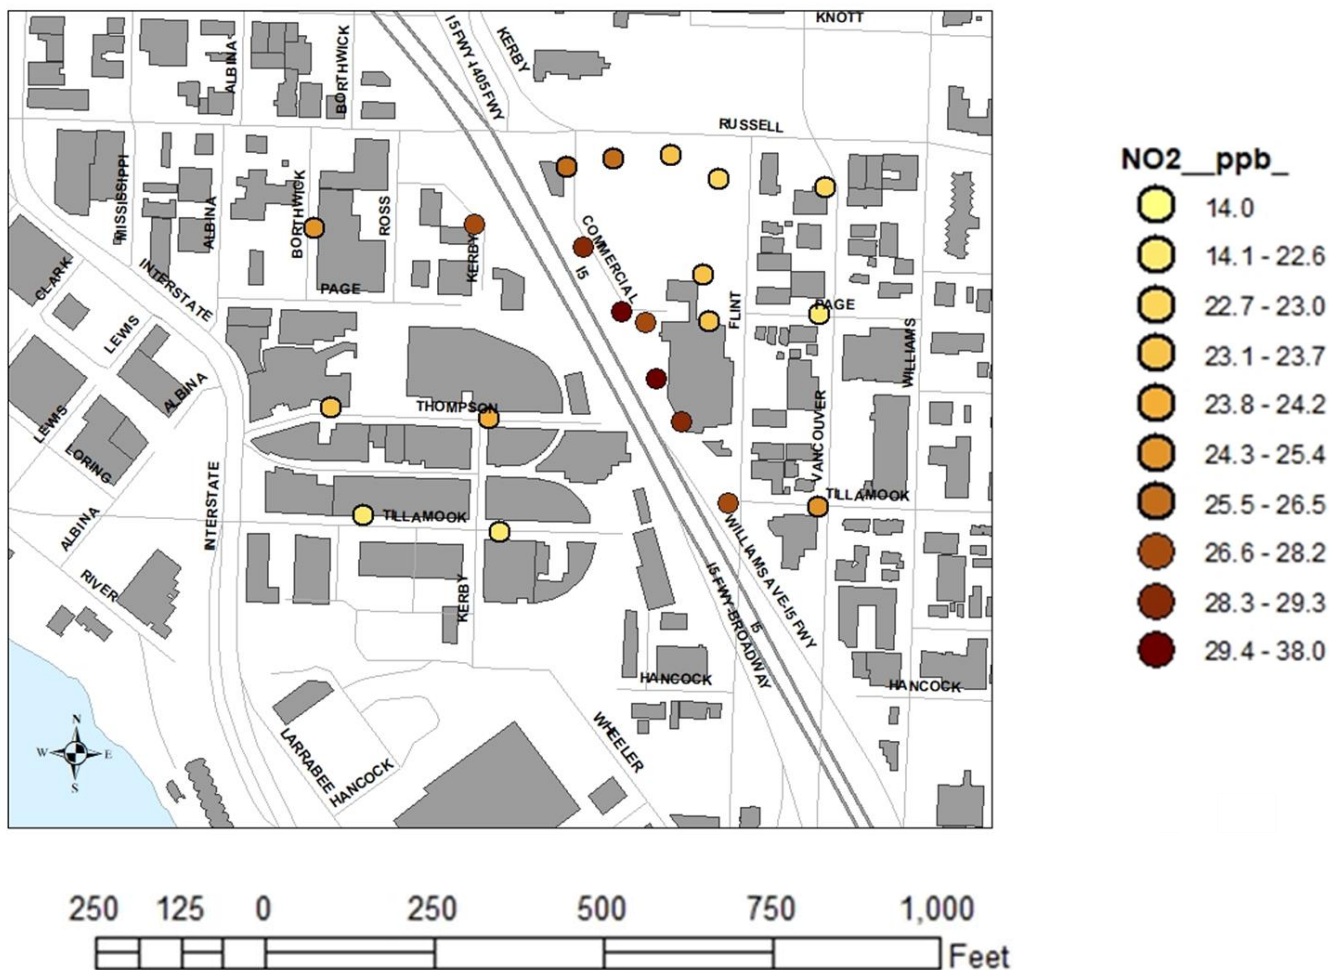

Megan Duenas

Graham Pridham

# Goal 4. Spatial variation of air pollution

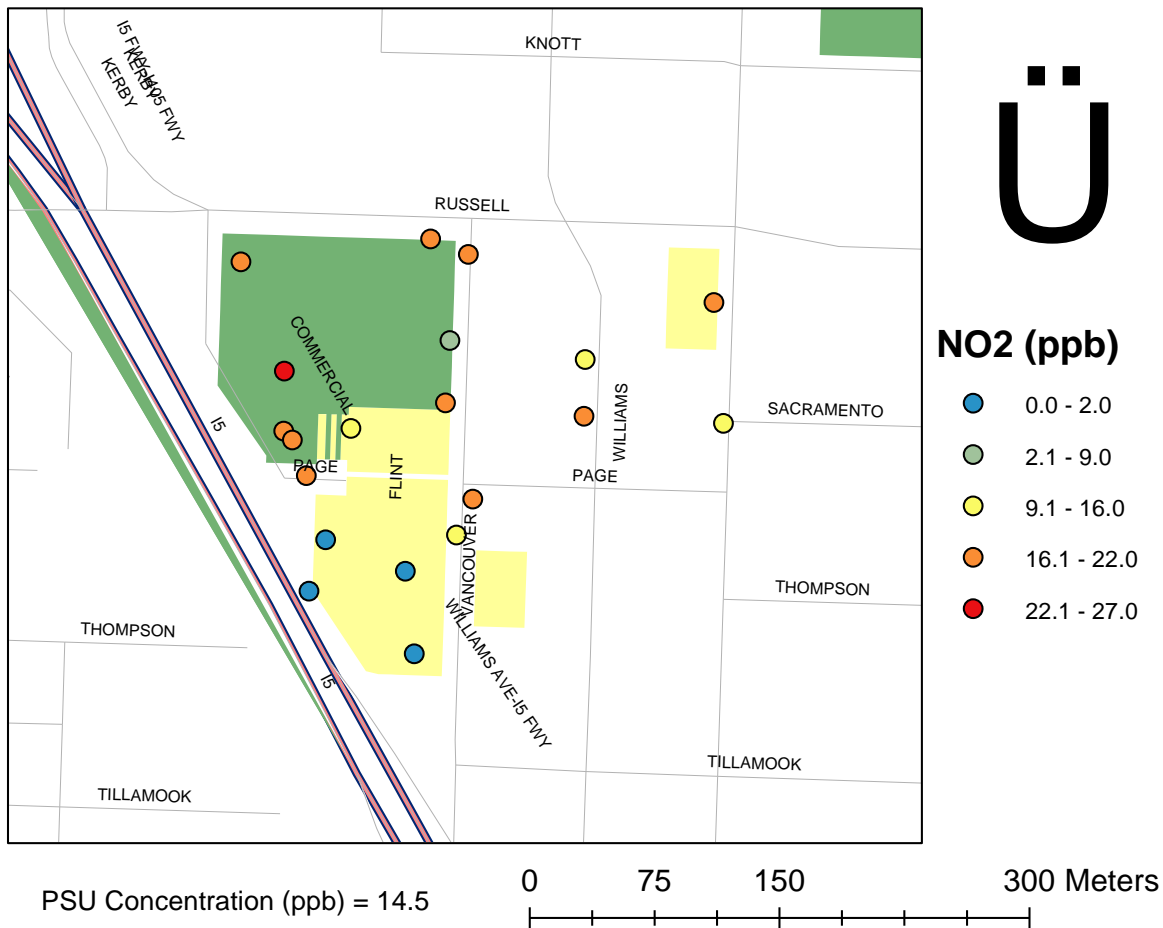

## 2/27-3/12/2018 Tubman Passively NO<sub>2</sub> Study

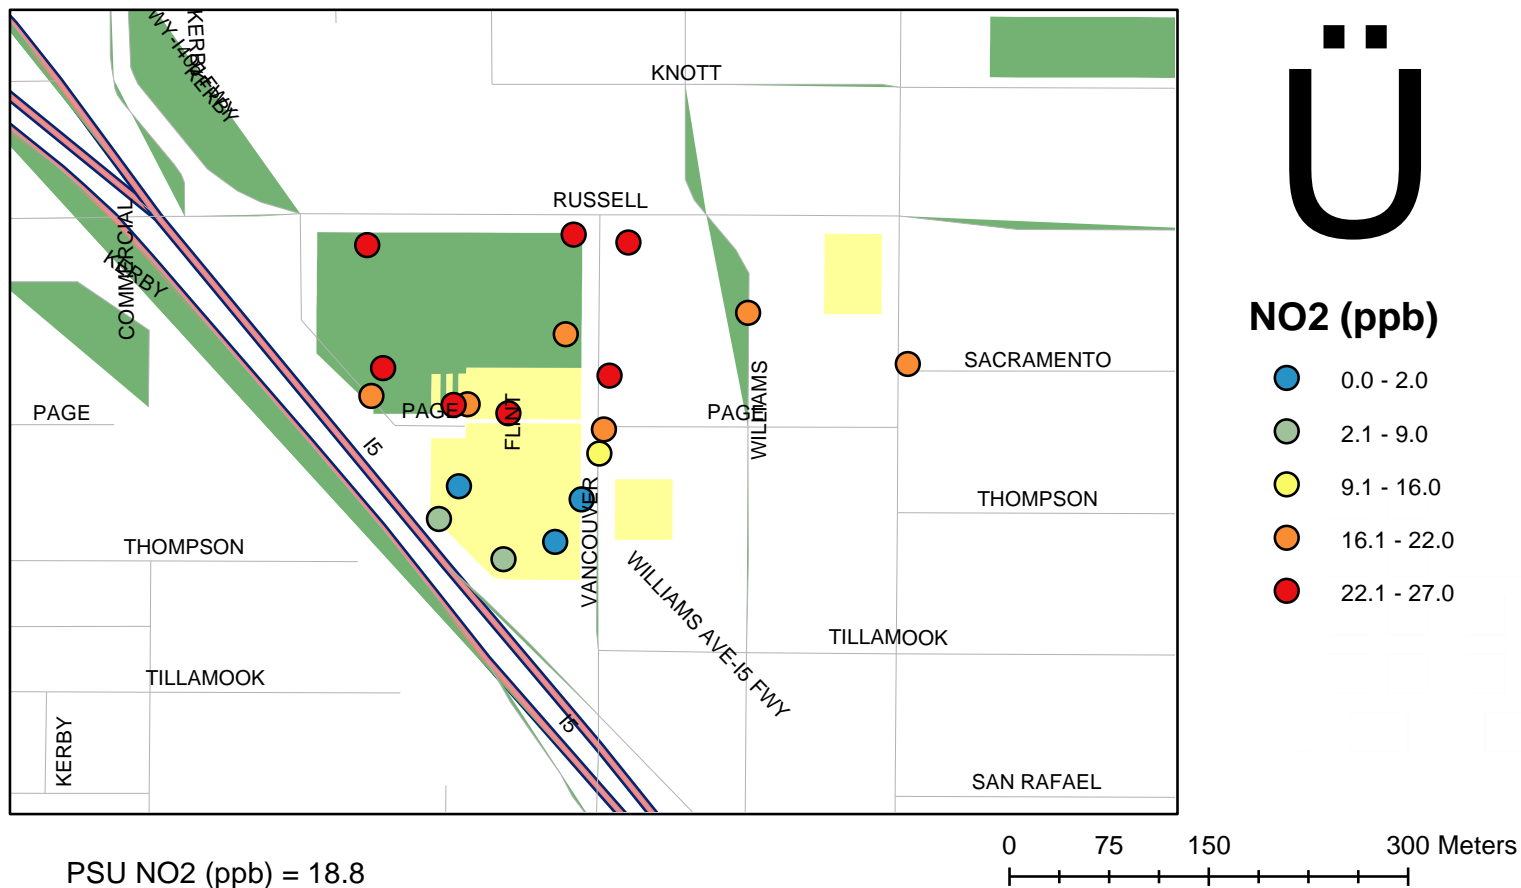

# Goal 4. Spatial variation of air pollution

Tubman 08/29-09/11

# Goal 4. Spatial variation of air pollution

## Tubman Fire Season 09/20-10/02

# Goal 4. Spatial variation of air pollution

# Goal 4. Spatial variation of air pollution

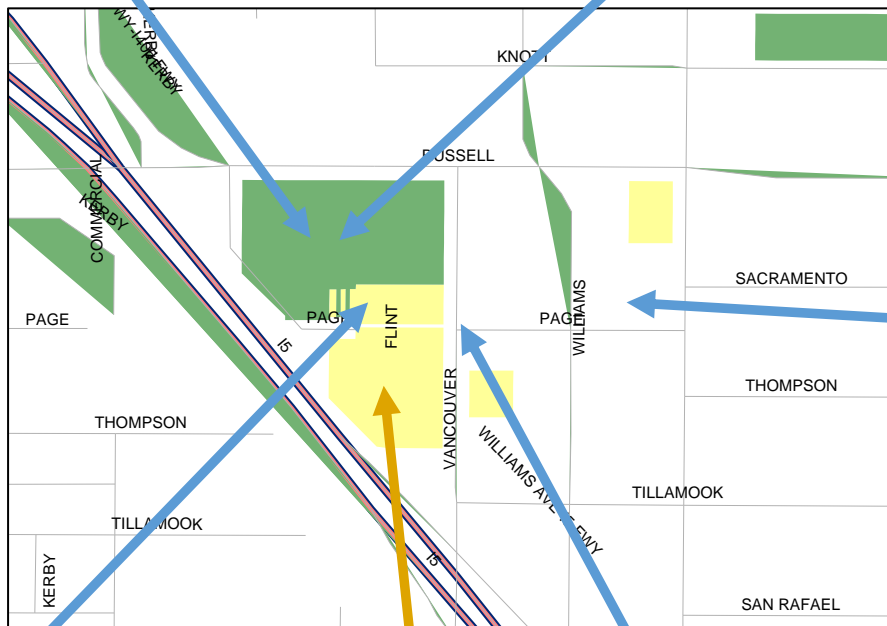

Morning:  
 8-9AM: **39K** (18/11)  
 9-10AM: **43K** (25/107)

Afternoon:  
 1-2PM : **14K** (12-98)

**Tubman 10/15/18**

After school:  
**6.6K** (5.2/12.2)

BB court 11:15-12:45PM  
**15K** (13/27)

Inside school:  
**0.3K** (0.2-2.6)

Dismissal 3:45-4:15PM  
**6.6K** (5.2/12.2)

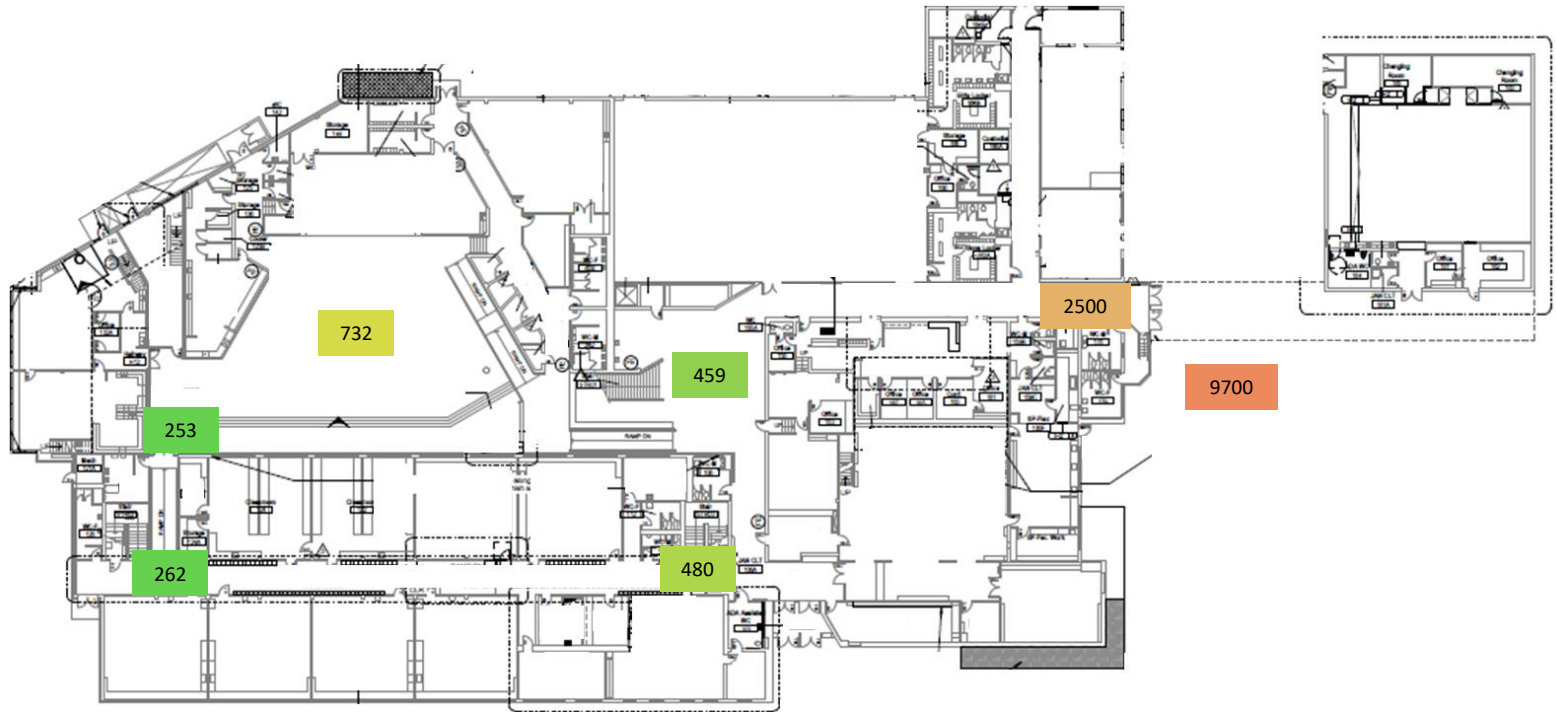

Ultrafine Particles  
**Median** (min/max)  
 # /cm<sup>3</sup>

# Goal 4. Spatial variation of air pollution

		Ultrafine particle counts	
		<i>Median value (min/max) x 1000 particle/cm<sup>3</sup></i>	
Location	Time	10/10/2018	10/15/2018
Morning transects were done in <b>Lillis Albina City Park</b> where the middle schoolers play at recess. There were a total of 4 transects per hour. The first transect started at the north end of the park and I moved south.	8AM - 9 AM	13 (11/41)	39 (18/110)
	9-10AM	26 (16/84)	43 (25/107)
Lunch sampling was done in Lillis Albina City Park and the <b>basketball court</b> at HTMS.	11:15 AM-12PM	10 (6.6/84)	15 (13/37)
	12PM-12:45 PM	8 (6.5/29)	16 (11/21)
Afternoon transects were done in <b>Lillis Albina City Park</b> where the middle schoolers play at recess. There were a total of 4 transects per hour. The first transect started at the north end of the park and I moved south.	1PM-2PM	13 (7.3/33)	14 (12/98)
Dismissal <b>Front of school</b> , just south of N Page St	3:45 PM -4:15 PM	6.8 (6.7/7.3)	6.6 (5.2/12.2)
<b>Neighborhood</b> Began east on N Russel Street then walked south on N Vancouver, north on Williams Ave, south on NE Rodney and then returned back to HTMS walking west on Tillamook.	after 4:15 PM	NA	5.4 (4.6/14)

# Indoor/outdoor levels: UFP

## First floor

# Indoor/outdoor levels: UFP

## Second floor

# Goal 4. Spatial variation of air pollution

---

## Summary of Goal 4

- Outdoor levels of NO<sub>2</sub> and UFP elevated at HTMS compared to urban background in the **morning and near freeway**
- UFP and NO<sub>2</sub> level are significantly reduced indoors compared to outdoor levels
